APPL-NO: JP11317468

APPL-DATE: November 8, 1999

INT-CL (IPC): G06F 15/00; G06F 13/00

ABSTRACT:

PROBLEM TO BE SOLVED: To prevent information from leaking to an authentication delegate server which acts for authentication.

SOLUTION: The authentication delegate server S distributes an open key for ciphering of service providers SP-A and SP-B made to correspond to desirable service to a client C and transfers ciphered information received from the client C to the providers SP-A and SP-B when the service is provided. The client C ciphers the information to be sent to the providers SP-A and SP-B by using the open key for ciphering received from an authentication delegate server S and sends the ciphered information to the authentication delegate server S. The providers SP-A and SP-B decipher the ciphered information received from the authentication delegate server S by using a secret key for ciphering.
